

PRODUCT DESIGN OFFICE · AI TRANSFORMATION

DESIGN AMPLIFIED

Design Amplified begins by helping people **work better today**, develops intelligence inside **critical workflows** next, and ultimately connects those capabilities into a globally reusable **Design-development system**.

Breadth first, *then controlled depth*

See the complete system before the mechanics. Scale Now, Develop Next, and Build Connected are not buckets — they are a progression.

Per-strategy roadmaps and full delivery evidence live in the appendix and AITO follow-up — the executive roadmap stays at the initiative level.

A globally connected, AI-enabled Design organization that **expands human creativity**, accelerates learning and decisions, **preserves Design intelligence**, and connects creative intent with trusted product information.

So Stellantis creates more distinctive, feasible, and valuable products - with greater speed and confidence.

WHAT CHANGES

- › Designers design more, search less
- › Trade-offs understood earlier
- › Program knowledge persists
- › Package & cost visible sooner
- › Proven workflows scale globally

Amplify

Expand the creative and decision-making capacity of the global Design organization.

Accelerate

Explore more alternatives, understand constraints sooner, reuse knowledge more effectively.

Preserve & Connect

Protect human Design judgment; keep program knowledge available as teams and phases change.

Design is getting more complex *and its knowledge is scattered*

Two forces are compounding. Amplification is the response to both.

Rising complexity

Every Design must now balance more, at once:

Fragmented knowledge

Critical information — and the reasoning behind decisions — is distributed across:

THE RESPONSE Amplify human judgment while reducing repetitive work — and connect scattered knowledge back into the moment of creation.

Transform the highest-value Design workflows by **scaling** proven AI, **developing** targeted workflow intelligence, and progressively **connecting** Design knowledge, geometry, package, engineering, and cost into trusted, reusable global capabilities.

SCALE

what already works

DEVELOP

where value is proven

CONNECT

into one system

Three strategies, *one progression*

From immediate capability to targeted development to long-term transformation. Each layer fulfils the one above it.

Strategy 01

1

Scale Proven Creative Enablement

Expand capabilities that are already demonstrating value and turn them into repeatable, approved, and measurable ways of working.

INITIATIVES

- AI-supported visualization & concept development
- Workflow-based AI training & adoption

Strategy 02

2

Develop Intelligence in Critical Design Workflows

Use structured discovery to convert high-potential opportunity areas into clearly defined, evidence-based products and capabilities.

INITIATIVES

- Design knowledge capture & retrieval
- AI vehicle packaging intelligence
- 3D surface geometry automation

Strategy 03

3

Build Connected Design Intelligence & Optimization

Connect trusted information and feedback loops across Design and adjacent enterprise systems so consequences are understood earlier.

INITIATIVES

- Design-to-BOM & cost-of-change intelligence
- Connected Design intelligence & optimization

Every initiative, *tied to its strategy*

Color signals the strategy each initiative advances. This is the full portfolio before we go deeper.

● Scale Now ● Develop Next ● Connect & Optimize

1Strategy 1

AI-Supported Visualization & Concept Development
Shorten the distance between an initial idea and organizational understanding.

2Strategy 1

Workflow-Based AI Training & Adoption
Turn tool deployment into behavior change inside the real work of Design.

3Strategy 2

Design Knowledge Capture & Retrieval
A governed, searchable memory for Design that preserves decision rationale.

4Strategy 2

AI Vehicle Packaging Intelligence
Earlier access to trusted package knowledge while the Design is still flexible.

5Strategy 2

3D Surface Geometry Automation
Automate repetitive geometry work; protect expert control of Design quality.

6Strategy 3

Design-to-BOM & Cost-of-Change Intelligence
Earlier visibility into the product, cost, and timing impact of Design changes.

7Strategy 3

Connected Design Intelligence & Optimization
Bring trusted knowledge and continuous technical feedback into the moment of creation.

Initiative 7 runs as two workstreams — 7A Design Intelligence Fabric and 7B Closed-Loop Optimization.

Strategy 01 Scale Proven Creative Enablement

1

AI-Supported Visualization & Concept Development

STAGE A

WHY

Real effort stands between a strong idea and shared understanding — refining, rendering, placing it in an environment, animating, and building the presentation.

WHAT CHANGES

- › More alternatives tested before commitment
- › Earlier, clearer communication of ideas
- › Less time preparing reviews
- › Leadership compares directions earlier

SCOPE / WHERE IT STARTS

Concept rendering, sketch-to-image, color & material exploration, contextual visualization, animation, presentation & review prep — with governance and measurement.

2

Workflow-Based AI Training & Adoption

STAGE A

WHY

Access to a tool does not change work. People need to know where AI applies, how to use it on a real assignment, what to protect, and how to judge output quality.

WHAT CHANGES

- › Approved capabilities used in core workflows
- › Role-based learning paths
- › AI Champion network for peer learning
- › Responsible use becomes routine

SCOPE / WHERE IT STARTS

Role-based paths, discipline-specific training, AI Champions, prompt & workflow libraries, coaching, adoption dashboards, and continuous improvement.

Strategy 02 Develop Intelligence in Critical Workflows

3

Design Knowledge Capture & Retrieval

STAGE B

WHY

Design creates valuable knowledge in reviews, decisions, critiques and historical programs — yet the reasoning behind decisions is often fragmented or lost.

WHAT CHANGES

- › Reliable, source-linked answers
- › Faster review preparation
- › Continuity between program phases
- › Preserved rationale; faster onboarding

SCOPE / WHERE IT STARTS

Start with a focused pilot on Design-review information for one program. Discovery defines sources, classification, traceability, ownership, access, and platform fit.

4

AI Vehicle Packaging Intelligence

STAGE B

WHY

Packaging sets the physical framework Design works within. Important constraints can become visible only after a direction has already advanced.

WHAT CHANGES

- › Comparable packages found quickly
- › Constraints understood earlier
- › Alternatives compared efficiently
- › Conflicts caught before major investment

SCOPE / WHERE IT STARTS

An assistant for H-Point & package-library search, architecture comparison, constraint explanation, dimensional alternatives, and basic conflict identification.

5

3D Surface Geometry Automation

STAGE B

WHY

Geometry development blends craftsmanship with repetitive technical work that consumes time expert sculptors could spend on visible Design quality.

WHAT CHANGES

- › Less manual effort on defined tasks
- › Faster iteration after package changes
- › Earlier geometry-error identification
- › More expert time on Design quality

SCOPE / WHERE IT STARTS

Bounded tasks — shut-face, B-side geometry, surface adaptation & morphing, foam-block prep, geometry checking. Discovery gauges feasibility and value.

Strategy 03 Build Connected Design Intelligence

6

Design-to-BOM & Cost-of-Change Intelligence

STAGE C

WHY

A visible Design change can ripple into parts, engineering, tooling, suppliers, weight, validation, timing and cost — consequences not immediately visible to Design.

WHAT CHANGES

- › Better-informed trade-offs
- › Fewer late surprises; reduced rework
- › Earlier cost awareness
- › Creative intent aligned to business reality

SCOPE / WHERE IT STARTS

A limited first feature or subsystem, connecting Design geometry, product definitions, engineering, BOM, suppliers, tooling, cost, timing, and historical changes.

7

Connected Design Intelligence & Optimization

STAGE C-D

WHY

Knowledge and product information are distributed across systems, regions and functions — rarely accessible in the context of an actual Design decision.

7A · Design Intelligence Fabric

The governed connective layer linking reviews & decisions, historical programs, package, geometry, materials, engineering, BOM & cost, suppliers, timing, and benchmarks — so many AI products can use consistent, traceable, protected information.

7B · Closed-Loop Optimization

Uses the fabric to give earlier feedback on alternatives — evaluated against package, aerodynamics, weight, cost, manufacturing, materials, and regulation. It informs consequences; the team still decides.

How it progresses: A · B · C · D

 discovery charter  build / pilot  matures & scales

From proven work today *to a system that learns*

Increasing organizational and technical capability. Not every initiative begins and ends in one stage — some start with discovery and mature across stages.

Evidence grows *as capability matures*

The same portfolio is measured differently at each maturity level — moving from problem sizing to proven, realized value.

DURING DISCOVERY

Stage A → B

- Problem size
- Time consumed
- Frequency
- Affected users
- Data readiness
- Feasibility confidence
- Value potential

DURING PILOTS

→ Stage B → C

- Task time
- Quality
- User satisfaction
- Reliability
- Accuracy
- Adoption intent
- Integration effort

DURING SCALE

→ Stage C → D

- Active use
- Cycle-time reduction
- Hours released
- Rework avoided
- Cost avoided
- Regional reuse
- Financial value realized

The same story, *two lenses*

Every executive question has an operational counterpart. One deck answers both audiences.

Why	Portfolio rationale & priority logic What problem is solved, why it matters, why AI is relevant, and why it deserves priority.
Goals	Roadmap commitments Milestones, owners, dependencies, resources, decision gates, timing, and scope boundaries.
Outcomes	Value & adoption measures Operational KPIs, financial outcomes, behavior change, scale & reuse, evidence against the business case.
Scope	Delivery definition Target users, workflow & data requirements, architecture, governance, regional implications, production support.

Four accountabilities, *end to end*

1 Own the roadmap

Define the portfolio, connect initiatives to strategy, set prioritization criteria, sequence discovery and delivery, assign owners as roles are staffed, and manage scale-or-stop decisions.

2 Deliver measurable value

Measure problem size and readiness in discovery; task time, quality and reliability in pilots; active use, cycle-time and financial value at scale.

3 Deliver & sustain adoption

Track activated users, repeat and in-workflow use, proficiency, retention, regional adoption, champion participation, and workflow-outcome improvement.

4 Contribute beyond Design

Share review-capture methods, retrieval patterns, ontology, data-certification practices, intake models, adoption playbooks, platform connections, and regional deployment methods.

The team *behind the roadmap*

Eight capability roles, grouped by the function they carry across the portfolio.

Connect & Govern

ICT AI Functional Lead

Connects the portfolio to enterprise architecture, approved platforms, ICT resources, cybersecurity, and production support.

Own & Define

AI Product Owners

Own workflow discovery, problem definition, requirements, product roadmaps, pilot definition, adoption logic, and scale recommendations.

Build

AI Engineers

Own prototyping, experimentation, solution engineering, integration, feasibility, reusable components, and deployment-ready assets.

Measure & Scale

Data & AI Analyst

Owns workflow baselines, adoption metrics, scorecards, business-case assumptions, value tracking, and outcome reporting.

AI Portfolio & Execution Lead

Owns intake, prioritization, stage gates, portfolio & maturity reporting, value tracking, and governance cadence.

AI & Data Manager

Owns trusted-data strategy, semantic consistency, ownership standards, certification, traceability, and data readiness.

Senior Data Engineers

Own data models, pipelines, integrations, transformation logic, quality, lineage, and reusable data assets.

Regional AI & Data Leads

Own local validation, regional priorities, constraints, pilot support, adoption, reuse, and feedback into the global portfolio.

We are clear about the future we are building and the strategic areas that matter. We are equally clear that several opportunities require **structured discovery** before the organization commits to a final solution or investment.

1

Scale where evidence exists

Expand what already works into repeatable, measurable capability.

2

Discover with discipline

Define the problem, data, and solution where the opportunity is strong but unproven.

3

Build the foundation incrementally

Add trusted data and connected capability as validated use cases become available.

4

Sharpen as evidence grows

An intentional model that protects investment, accelerates learning, and directs resources.

This is not uncertainty without direction. *It is an intentional transformation model — and the roadmap becomes more precise as the team produces better evidence.*

The same roadmap, *one strategy at a time*

For operational follow-up — the main deck uses the single integrated view. Each strategy reads left-to-right across the horizon.

Solid = build / scale · dashed = discovery. The main-deck roadmap overlays all three of these rails into one integrated view.
